

2

With [express-sitemap-html](#) you may automatically generate a minimalistic Open API definition (only including route parameters) and install a Swagger UI for all routes of an existing express app. You only need:

```
const sitemap = require('express-sitemap-html')
...
sitemap.swagger('Your app name', app) // given that app is an express instance
```

Instead of analyzing HTTP requests at runtime, this approach inspects express `app` instance and mounted routes.

PROs you don't need to perform ahead requests to get an updated list of available routes.

CONS it provides untyped parameters features.
