express-sitemap-html

An express middleware that builds an HTML sitemap dynamically. This is **NOT** an alternative to sitemap.xml, but an additional feature that helps users (and developers) to find and test routes of an express application.

Usage

express-sitemap-html offers an easy way to get an up-to-date HTML index with the endpoints of an express application. It renders a snapshot of all paths of your express application, as links to the corresponding pages, which you can easily navigate (such as a table of contents of your application).

Alternatively you may generate a minimalistic Swagger UI with additional capabilities for route parameters inferred from installed express routes.

```
const express = require('express')
const sitemap = require('express-sitemap-html')

const app = express()
//... configure routes for the app express

// Add a route to the sitemap
app.get('/sitemap', sitemap(app))

// Alternatively auto generate and install a swagger UI for given
express app:
sitemap.swagger('Your app name', app) // available at /api-docs
```

Installation

```
$ npm install express-sitemap-html
```
